

1.2.1.7 Detect and characterise waves in closed and open structures

Detect and characterise waves in closed and open structures (e.g. De Pontieu et al., 2007), looking for signatures of their dissipation in the transition region and low corona, with a corresponding evaluation of the energy released to heat the solar plasma.

Targets: AR (also closed loops in QS?), on-disk and also off-limb (for spicules).

Spicules:

Maybe divide this objective per target?
